ABSTRACTED-PUB-NO: DE19617338A

BASIC-ABSTRACT:

Device for identification of microorganisms, fungi and minute life forms, uses mechanically and chemically stable indicator beads having indicator molecules durably bonded to the surface which undergo a distinctive change in colour or fluorescence after contact with microorganisms or fungi or their metabolic products or metabolic intermediate products which serves to identify the organism.

Preferably:

- (i) the bond between the indicator and the substrate bead is permanent,
- (ii) the bond between the indicator and the bead is a covalent bond, an ionic bond or an adhesive bond,
- (iii) contact of the indicator with the substances to be identified can be detected by a change in the spectral properties of the indicator molecule
- (iv) the beads themselves are composed of chemically and mechanically inert material,
- (v) the beads are capable of forming one or other of the above bonds,
- (vi) the diameter of the beads is 5-1500 nm,
- (vii) a single bead carries at least 1 indicator molecule and
- (viii) the surface of a bead is durably bonded with a fluorescein compound, especially fluorescein acid derivatives such as fluorescein diacetate compounds, to allow identification of bacterial lipases by a change in fluorescence.

USE - The device is especially used for identification of bacteria which cause life-threatening illnesses.

ADVANTAGE - The system offers rapid and accurate identification of bacteria and other microorganisms and is quicker and easier to operate than the agar plate method used previously while exposing laboratory personnel to less risk of infection.

Unlike previous methods, the results can be determined instrumentally, thus allowing the possibility of automatic or semi-automatic operation.
